

## Expressions and Operators

- Operator is an object in computer programming that return a value by evaluating any given expression.
- Operators in JavaScript are classified into following groups

### Assignment Operators:

- Assigns a value to its left operand based on the value of its right operand

| Operator                  | Shorthand method | Meaning     |
|---------------------------|------------------|-------------|
| Assignment                | $X = Y$          | $X = Y$     |
| Addition Assignment       | $X += Y$         | $X = X + Y$ |
| Subtraction Assignment    | $X -= Y$         | $X = X - Y$ |
| Multiplication Assignment | $X *= Y$         | $X = X * Y$ |
| Division Assignment       | $X /= Y$         | $X = X / Y$ |

|                         |            |              |
|-------------------------|------------|--------------|
| Remainder<br>Assignment | $X \% = Y$ | $X = X \% Y$ |
| Exponent<br>Assignment  | $X ** = Y$ | $X = X ** Y$ |

## Arithmetic Operators:

- Returns a number by handling any expression that evaluates a value.
- Arithmetic expression always returns a number.

| Operator | Description  |
|----------|--|
| +        | Addition   |
| -        | Subtraction  |
| *        | Multiplication   |
| /        | Division   |
| %        | Modulus Division   |
| **       | Exponent [New in ES5]<br><br>Early version use<br>"Math.pow(number,power)"<br><br>Ex:<br><br>Math.pow(2,3);<br><br>2**3; |

|    |                       |
|----|-----------------------|
| ++ | Increment $x = x + 1$ |
| -- | Decrement $x = x - 1$ |

Ex:

## Pre and Post Increment

Post: It will assign and then increment or decrement.

$X++$

Pre: It will increment or decrement and then assign.

$++X$

Ex:

<script>

```
function f1(){
```

```
    var x = 10;
```

```
    var y = x++;
```

```
    document.write(`X=${x}<br>Y=${y}`);    // x = 11, y=10
```

```
}
```

```
f1();
```

</script>

Ex:

```
<script>
    function f1(){
        var x = 10;
        var y = ++x;
        document.write(`X=${x}<br>Y=${y}`);    // x =
11, y=11
    }
    f1();
</script>
```

Ex:

```
<script>
    function f1(){
        var x = 10;
        var y = x--;
        document.write(`X=${x}<br>Y=${y}`); // x = 9,
y=10
    }
    f1();
</script>
```

FAQ:

String + String = string;

String + Number = String;

Number + Number = Number;

Number + Boolean = Number;

Boolean + Boolean = Number;

FAQ: Chaining

```
<script>
```

```
function f1(){
```

```
    var x = 10;
```

```
    var y = 20;
```

```
    var z = (x = y); // z=x=y;
```

```
    document.write(`Z=${z}`); // Z = 20
```

```
}
```

```
f1();
```

```
</script>
```

Ex:

```
<script>
```

```
function f1(){
```

```
var x = 10;
var y = 20;
var z = 30;
var a = (z=(x = y));
document.write(`a=${a}`);
}
f1();
</script>
```

Ex:

```
<script>
function f1(){
    var x = 10;
    var y = 20;
    var z= 30;
    var a = z += x *= y
    document.write(`a=${a}`);
}
f1();
</script>
```

## Comparison Operators

| Operator | Description                                  |
|----------|--|
| ==       | Equal [It can convert and compare]           |
| !=       | Not Equal                                    |
| ===      | Strict Equal [Compare only same type values] |
| !==      | String not equal.                            |
| >        | Greater than                                 |
| >=       | Greater than or equal                        |
| <        | Less than                                    |
| <=       | Less than equal                              |

Ex:

```
<script>
```

```
function f1(){  
    var x = "10";  
    var y = 10;  
    document.write("x===y=" + (x===y)); // false  
}  
f1();
```

</script>

Ex:

<script>

```
function f1(){  
    var x = "10";  
    var y = 10;  
    document.write("x==y=" + (x==y)); // true  
}  
f1();
```

</script>

## Logical Operators

| Operator | Description |
|----------|-------------|
| &&       | Logical AND |
|          | Logical OR  |
| !        | Logical NOT |

## Special Operators

| Operator | Description |
|----------|-------------|
|----------|-------------|

|        |  |
|--------|--|
| typeof | <p>It is used to verify and return the data type of value stored in a reference.</p> <p>Ex:</p> <pre>&lt;script&gt;  function f1(){     var product = {         Name: "TV",         Price: 45000.44,         InStock: true,     }      document.write(`         Type of Name : \${typeof product.Name} &lt;br&gt;          Type of Price: \${typeof product.Price} &lt;br&gt;          Type of Stock: \${typeof product.InStock}      `); }</pre> <p>f1();</p> |
|--------|--|

|                |  |
|----------------|--|
|                | </script>  |
| instance<br>of | <p>It is used to verify whether the given object derived from specific class and return true or false.</p> <p>EX:</p> <pre> &lt;script&gt;     class Employee {      }      function f1(){         var pic = new Image();         var products = new Array();         var emp = new Employee();          document.write(`Pic is Employee : \${pic instanceof Employee}&lt;br&gt;`);          document.write(`Pic is Image: \${pic instanceof Image}&lt;br&gt;`);          document.write(`Emp is Array: \${emp instanceof Array}&lt;br&gt;`); </pre> |

|        |   |
|--------|---|
|        | <pre>         document.write(`Emp is Employee:         \${emp instanceof Employee}&lt;br&gt;`);          document.write(`Emp is Object:         \${emp instanceof Object}`);      }      f1();  &lt;/script&gt; </pre>  |
| delete | <p>It is used to delete any property from an object.</p> <p>You can't delete properties of built in object.</p> <p>Ex:</p> <pre> &lt;script&gt;      class Employee {      }      function f1(){         var product = {             Name: "TV",             Price: 45000.55 </pre> |

|    |  |
|----|--|
|    | <pre> };  var pic = new Image();  delete pic.src; // invalid delete Math.PI; // invalid delete product.Price;  document.write(`Name=\${product.Name} &lt;br&gt; Price=\${product.Price}&lt;br&gt;`);      document.write(Math.PI); }  f1(); &lt;/script&gt; </pre> |
| in | <p>It is used to check for a property in an object and return true if it is available.</p> <p>Syntax:</p> <p>“PropertyName” in ObjectName</p> <p>Ex:</p> <pre>&lt;script&gt;</pre>   |

|    |   |
|----|---|
|    | <pre>function f1(){     var product = {         Name: "TV",         Price: 45000.55     };     delete product.Price;     document.write(`Is Price Available in Product :\${"Price" in product} `) } f1(); &lt;/script&gt;</pre> |
| of | <p>It is used to access a value from collection using iterator.</p> <p>It requires an iterator to read values from collection.</p> <p>Syntax:</p> <pre>for(var item of collection) { }</pre>                                    |

|     |   |
|-----|---|
|     | <p>Ex:</p> <pre>&lt;script&gt;    function f1(){     var products = ["TV", "Mobile", "Shoe"];     for(var item of products) {       document.write(item + "&lt;br&gt;");     }   }    f1(); &lt;/script&gt;</pre>               |
| new | <p>It is dynamic memory allocating operator.</p> <p>It allocates memory for an object and loads its members into memory.</p> <p>Syntax:</p> <pre>var products = new Array(); var now = new Date(); var pic = new Image();</pre> |

|    |   |
|----|---|
| ?: | <p>It is ternary operator.</p> <p>Syntax:</p> <p>(condition)?statement_true:<br/>statement_false</p> <p>Similar to “if..else”</p> |
|----|---|
